ANGLE BRACKETS

GREENLINE

TOPLINE

# ANGLE BRACKETS

## ANGLE BRACKETS TOP 80 / TOP 120

### Advantages

- No bothersome centre rib during processing
- Optimised hole pattern
- Full nail fitting always possible
- High stability due to special, discreet corrugation
- Type 80 as an alternative to the "size 90 bracket"
- GREENLINE = resource-saving manufacturing

Introduction to statics [from page 110](#) / Products & statics [from page 120](#)

## ANGLE BRACKET 110/170 S

### Advantages

- Universal use for higher loads
- 9 bolt holes Ø 13 mm
- Perfectly suited to take loads  $F_2$  and  $F_3$

Introduction to statics [from page 110](#) / Products & statics [from page 132](#)

## ANGLE BRACKET TOP KR 90E (EXTRA)

### Advantages

- 40 % lighter in comparison to 90 x 90 x 65 x 2.5 mm
- High stability due to raised edge on both sides
- Versatile in use
- Alternative to different brackets such as 70 x 70 x 55 mm and 90 x 90 x 65 mm (for use under consideration of the necessary loads)
- Very good for loads due to the outer rib  $F_2/F_3$  and  $F_1$  suitable

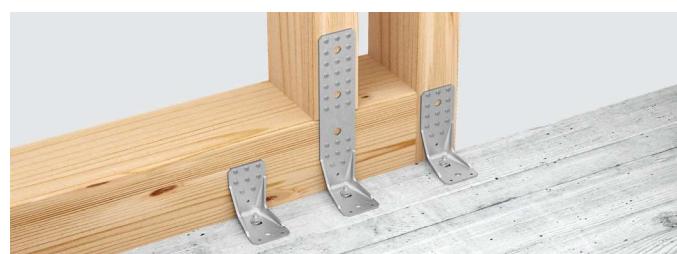

Introduction to statics [from page 110](#) / Products & statics [from page 124](#)

## ANGLE BRACKETS KR

### Advantages

- For connections between timber/timber; timber/concrete  
For use on timber/masonry etc.
- Due to the ribs in the bending radius, KR angle brackets are very sturdy, economical and affordable in use for extreme loads
- By making use of the Greenline series, you receive products with resource-saving manufacturing. This gives you an ecologically and economic advantage

**Usage class 1**

Moisture content in the building materials that corresponds to a temperature of 20° C and a relative humidity of the ambient air that only exceeds a value of 65% for a few weeks per year, e.g. in the case of buildings that are closed on all sides and heated.  
Comment: In UC 1, the average moisture content of most softwoods does not exceed 12 %.

**Usage class 2**

Moisture content in the building materials that corresponds to a temperature of 20° C and a relative humidity of the ambient air that only exceeds a value of 85% for a few weeks per year, e.g. in the case of open buildings covered by a roof.  
Comment: In UC 2, the average moisture content of most softwoods does not exceed 20 %.

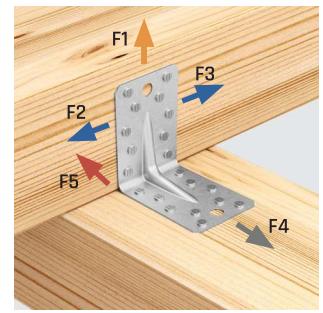

**Usage class 3**

Includes climatic conditions that lead to higher moisture contents than in UC 2, e.g. structures that are exposed to the weather without protection.

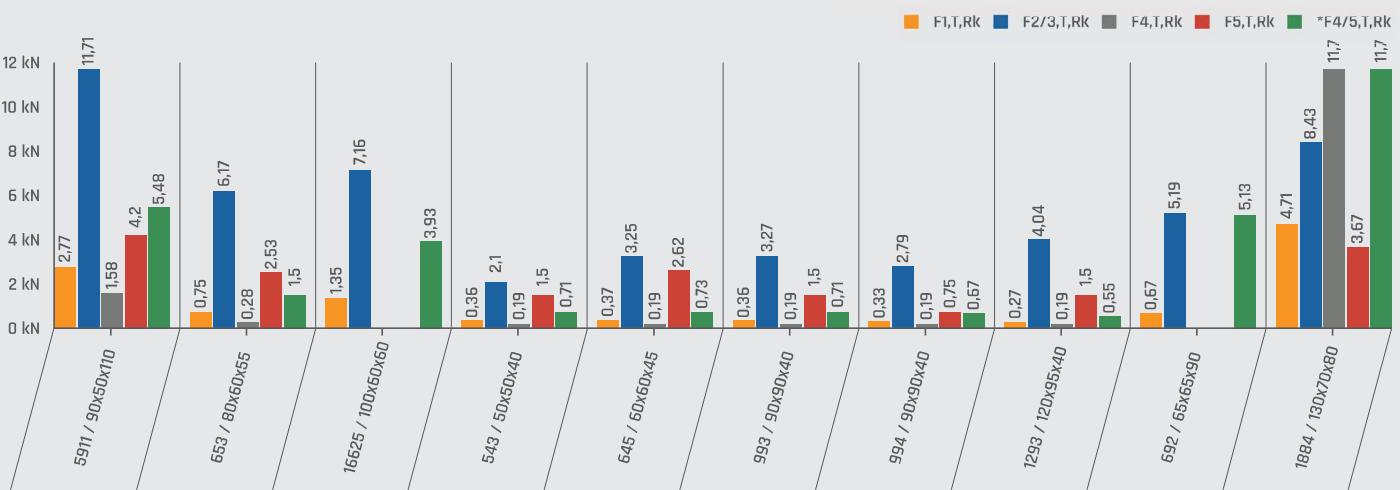

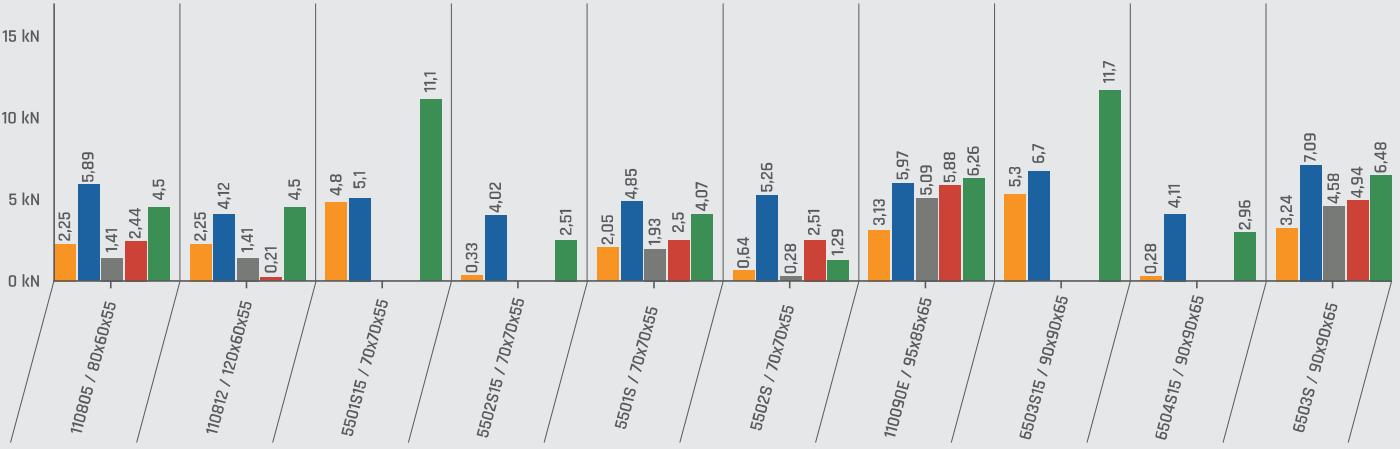

Eurocode 5 / DIN EN 1995-1-1 section 2.3.1.3

## Design

$F_{1,Ed}$	Design load for load direction 1 in kN
$F_{2/3,Ed}$	Design load for load direction 2 or 3 in kN
$F_{4,Ed}$	Design load for load direction 4 in kN
$F_{5,Ed}$	Design load for load direction 5 in kN
$F_{4/5,Ed}$	Design load for load direction 4 or 5 in kN
$F_{1,Rk}$	Characteristic value of the load capacity in load direction 1 for one or for two angle brackets in kN
$F_{2/3,Rk}$	Characteristic value of the load capacity in load direction 2 or 3 for one or for two angle brackets in kN
$F_{4,Rk}$	Characteristic value of the load capacity in load direction 4 for one angle bracket in kN
$F_{5,Rk}$	Characteristic value of the load capacity in load direction 5 for one angle bracket in kN
$F_{4/5,Rk}$	Characteristic value of the load capacity in load direction 4 or 5 for two angle brackets in kN
$F_{1,Rd}$	Design value of the load capacity in load direction 1 for one or for two angle brackets in kN
$F_{2/3,Rd}$	Design value of the load capacity in load direction 2 or 3 for one or for two angle brackets in kN
$F_{4,Rd}$	Characteristic value of the load capacity in load direction 4 for one angle bracket in kN
$F_{5,Rd}$	Characteristic value of the load capacity in load direction 5 for one angle bracket in kN
$F_{4/5,Rd}$	Characteristic value of the load capacity in load direction 4 or 5 for two angle brackets in kN
$F_{i,Ed}$	Design value of load capacity for one or two angle brackets for the respective load direction "i" (i = 1 to 5) in kN
$F_{i,Rk,T}$	Characteristic value of the load-bearing capacity of the sheet steel-timber connection with GH threaded/anchor nails for the "i" (i = 1 to 5) in kN respective load direction "i" (i = 1 to 5) in kN
$F_{i,Rk,S}$	Characteristic value for steel load capacity of the bracket (table value „S“ oder $F_{Rk,S}$ bzw. $F_{Rd,S}$ ) for the respective load direction "i" (i = 1 to 5) in kN
$k_{mod}$	Modification factor for load impact duration and usage class
$\gamma_{M,T}$	Partial safety factor for timber (for Germany: 1.3)
$\gamma_{M,S}$	Partial safety factor for steel for cross-section stresses (for Germany: 1.0)

## Dowel design

$k_{i,t,ox}$	Coefficient for calculating the axial load-bearing capacity per bolt, for connecting the bracket to concrete or steel components for the respective Load direction "i" (i = 1 to 5)
$k_{i,t,v}$	Coefficient for calculating the shear load-bearing capacity per bolt, for connecting the bracket to concrete or steel components for the respective Load direction "i" (i = 1 to 5)
$F_{i,Ed}$	Design load on one or two angle brackets for the respective load direction "i" (i = 1 to 5) in kN
$F_{i,Rd}$	Design value of load capacity on one or two angle brackets for the respective load direction "i" (i = 1 to 5) in kN
$F_{i,Ed,B}$	Design value for one bolt or one anchor for the respective load direction "i" (i = 1 to 5) in kN
$F_{i,Rd,B}$	Design value of the load-bearing capacity of the entire connection to concrete or steel with bolts or anchors for the respective Load direction "i" (i = 1 to 5) in kN (calculation must be carried out separately and is based on the respective approval and standard of the bolts or anchors)

### For use in usage classes

### Connecting element:

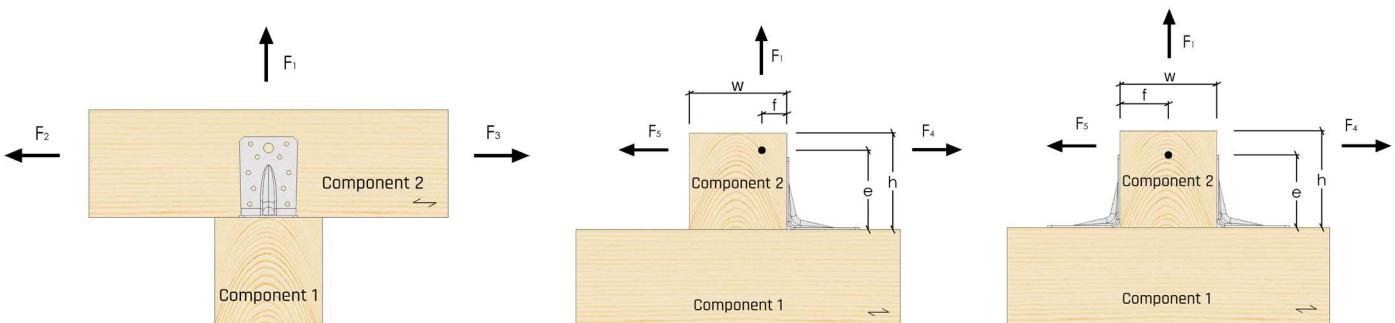

GH threaded nails 4.0 x 35 / 40 / 50 / 60 / 75 / 100 mm  
GH screws 5.0 x 25 / 35 / 40 / 50 / 60 / 70 mm

Bolt, dowel or concrete anchor M10, M12

Connecting elements from page 274

# ANGLE BRACKETS

## LOAD DIRECTIONS

3

### Load $F_1$ :

For the load-bearing capacity of a bracket, the load is applied at spacing  $f$  from the contact surface between the bracket and the timber beam is applied (Figure 2). If it is assumed that the timber component is prevented from rotating or if two console angles are arranged, then the eccentricity is  $f = 0$ .

### Load $F_{2/3}$

Calculation of the load-bearing capacity of one or two angle brackets that are loaded with a force in the direction of the axis of component 2 (Fig. 1).

### Load $F_4 / F_5 / F_{4/5}$

In all three cases, the load is applied at a distance  $e$  from the contact surface between component 1 and component 2 (Figure 2). The load cases are considered as a combination of two base load cases.

The first base load case is the lateral load with forces  $F_4$ ,  $F_5$  or  $F_{4/5}$  with  $e = 0$ .

For the arrangement with an angle bracket, the rotation of component 2 is taken into account.

For the arrangement with two angle brackets, the rotation of component 2 is prevented and the load on the beam due to the moment is calculated as the lifting force  $F_1 = F_{4/5} \times e/w$ .  $w$  is thereby the width of component 2

### Nail patterns

Partial and full nail fitting or partial and full screw fitting

See nail pattern for the product

### Connection over intermediate layers

The characteristic load capacities for the connection with angle brackets indicated in the tables also apply to an intermediate layer between the angle bracket and timber component. The following conditions must be met:

- The intermediate layer must be connected to the timber component without being able to be moved.
- The insert depth of the profiled area of the nail or the thread length of the screw in the timber component must be the same or greater.
- For this, a correspondingly long connecting element must be used.
- The characteristic perforation strength  $f_{h,k}$  of the connecting element in the intermediate layer must be the same or greater.

### Determination of load capacity

The load capacity of connections with angle brackets  $F_{i,Rd}$  for the respective load direction "i" ( $i = 1$  to 5) corresponds to the smallest value of:

- The load capacity of the steel sheet-timber connection with GH threaded/anchor nails  $F_{i,Rd,T}$
- Steel load capacity of the bracket  $F_{i,Rd,S}$
- Load-bearing capacity of the connection to concrete or steel with bolts or anchors under consideration of the coefficient  $k_{i,t,ox}$  or  $k_{i,t,v}$ , see section 4.

$$F_{i,Rd} = \min \left\{ \frac{k_{mod} \cdot F_{i,Rk,T}}{\gamma_{M,T}}; \frac{F_{i,Rk,S}}{\gamma_{M,S}}; F_{i,Rd,B} \right\}$$

The increased load capacity values of the GH threaded/anchor nails according to ETA-13/0523 apply.  
The values of EN14592 apply to angle brackets made of stainless steel.

### Connection timber- concrete/ steel

The design load of the respective load direction "i" (i = 1 to 5)  $F_{i,Ed,\beta}$  for one bolt or for one anchor is calculated as follows:

$$\begin{aligned} F_{i,Ed,B} &= k_{i,t,ax} \times F_{i,Ed} && \text{for axial stress on the bolt or anchor} \\ F_{i,Ed,B} &= k_{i,t,v} \times F_{i,Ed} && \text{for lateral stress on the bolt or anchor} \end{aligned}$$

#### Load in one direction

In case of sole impact of load components  $F_1$ ,  $F_{2/3}$ ,  $F_4$  or  $F_5$  or  $F_{4/5}$  the proof of interaction must be provided in the following form:

3

$$\frac{F_{i,Ed}}{F_{i,Rd}} \leq 1$$

#### Load in several directions

In case of simultaneous impact of load components  $F_1$ ,  $F_{2/3}$ ,  $F_4$  or  $F_5$  and  $F_{4/5}$  the proof of interaction must be provided as follows:

For a bracket, the loads  $F_4$  and  $F_5$  never take effect at the same time.

#### For one bracket:

$$\left(\frac{F_{1,Ed}}{F_{1,Rd}}\right)^2 + \left(\frac{F_{2/3,Ed}}{F_{2/3,Rd}}\right)^2 + \left(\frac{F_{4,Ed}}{F_{4,Rd}}\right)^2 + \left(\frac{F_{5,Ed}}{F_{5,Rd}}\right)^2 \leq 1$$

#### For two brackets:

$$\left(\frac{F_{1,Ed}}{F_{1,Rd}}\right)^2 + \left(\frac{F_{2/3,Ed}}{F_{2/3,Rd}}\right)^2 + \left(\frac{F_{4/5,Ed}}{F_{4/5,Rd}}\right)^2 \leq 1$$

#### General information

The load capacities apply to timbers with a characteristic raw density of 350 kg/m<sup>3</sup>.

Curvatures of the timber components and joist edges in the area of the angle brackets are not permitted - the wood must be sharp-edged in the area of the bracket.

There must be proof that no gaps occur in the timber component for all load directions according to EN 1995 or an equivalent national standard.

#### Minimum spacing according to EN 1995-1-1

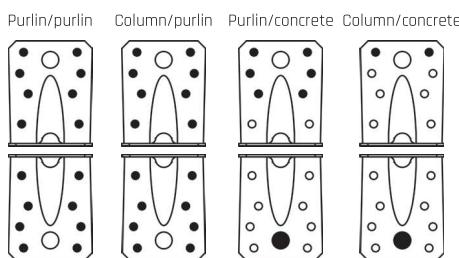

[mm]		Force parallel to the grain	Force at a right angle to the grain	Force under the bracket $\alpha$ to the grain
		( $\alpha = 0^\circ$ )	( $\alpha = 90^\circ$ )	( $\alpha$ any)
$\alpha_1$	in grain direction	28	14	(14+14 x cos $\alpha$ )
$\alpha_2$	Right angle to the grain direction	14	14	14
$\alpha_{3,t}$	End grain with stress	60	40	(40 + 20 x cos $\alpha$ )
$\alpha_{3,e}$	End grain without stress	40	40	40
$\alpha_{4,t}$	Loaded edge	20	28	(20 + 8 x sin $\alpha$ )
$\alpha_{4,e}$	Unloaded edge	20	20	20

Nails Ø 4 mm, without pilot drilling, in nail plates, pk ≤ 420 kg/m<sup>3</sup>

**GREENLINE KR brackets in 3 mm are statically almost identical to the KR brackets in 4 mm.**

KR brackets in 3 and 4 mm with round hole or slotted hole are used for connections between wood/wood; wood/concrete; wood/steel and wood/masonry. Due to the ribs in the bending radius, KR connectors are extremely sturdy and can be used cost-effectively for high loads. These properties are primarily required for connections to columns, sleepers, timber trusses and beams. The 4 mm KR brackets are subsequently galvanised.

**GREENLINE KR brackets in 3 mm are statically almost identical to the KR brackets in 4 mm.**

KR brackets in 3 and 4 mm with round hole or slotted hole are used for connections between wood/wood; wood/concrete; wood/steel and wood/masonry. Due to the ribs in the bending radius, KR connectors are extremely sturdy and can be used cost-effectively for high loads. These properties are primarily required for connections to columns, sleepers, timber trusses and beams. The 4 mm KR brackets are subsequently galvanised.
