General
Post supports are approved for service classes 1,2 and 3 .
Timber column
Softwood, C24 or higher strengths
Glulam
Minimum dimensions $\boldsymbol{\operatorname { m i n }} \mathbf{w} \mathbf{x} \boldsymbol{\operatorname { m i n }} \mathbf{h}$ see structural calculations table

| Timber column fasteners |  |
| :---: | :---: |
| Wood screws | $\varnothing 8 \times 70-\ell_{\text {ef }} \geq 50 \mathrm{~mm}$ |
|  | $\varnothing 10 \times 120-\ell_{\text {ef }} \geq 100 \mathrm{~mm}$ |
|  | $\varnothing 10 \times 60, \varnothing 4 \times 60-\ell_{\text {ef }} \geq 40 \mathrm{~mm}$ |
|  |  |
|  | If screws with thread length $\ell_{\text {ef }}$ greater than 100 mm are used, the resistance can be increased, see structural calculations table, index d) |
| Dowel | $\varnothing 8 \mathrm{~mm}, \varnothing 10 \mathrm{~mm}$ and $\varnothing 12 \mathrm{~mm}$, at least S235 |

## In concrete

The minimum concrete encased depth for concrete encased post supports is 150 mm .

## Structural calculation tables

## General

The table contains characteristic values of the resistance/load-carrying capacity for determining design values in ultimate limit state.
The resistances/load-carrying capacities apply to the maximum distances given in the structural calculation tables of the load application points from the top of the substrate.
The verification of anchoring of the post support in the subsoil must be provided separately.
In case of horizontal loading of the post support, it is recommended to verify the resistance with the lower value
of the resistances $\mathrm{F} 2 / 3$ and $\mathrm{F} 4 / 5$, if correct layout of the post support in the place of installation is not checked.

## Minimum and maximum distances

Distance from top of baseplate - top of substrate, see structural calculations table max a
$e_{2 / 3}$ - maximum distance between load application - top of substrate in load case $F_{2 / 3}$
$e_{4 / 5}$ - maximum distance between load application - top of substrate in load case $F_{4 / 5}$
The distances $\mathrm{e}_{2 / 3}$ and $\mathrm{e}_{4 / 5}$ result from the distance max a and the centre of gravity of the load application for the load cases $\mathrm{F} 2 / 3$ and $\mathrm{F} 4 / 5$.

$$
\sum F_{-}(i, E d) / F_{-}(i, R d) \leq 1 \rrbracket
$$

$\mathrm{F}_{4 / 5}$

$\mathrm{F}_{1, \mathrm{c}}$ - compressive force (downwards) perpendicular to the baseplate
$\mathrm{F}_{1, \mathrm{t}}$ - tensile force (upwards) perpendicular to the baseplate
$\mathrm{F}_{2 / 3}$ - load perpendicular to fasteners in the fin, dowel, ties
$\underset{\mathrm{Fsis}^{\circ}}{ } \quad \mathrm{F}_{4 / 5}$ - load parallel to fasteners in the fin, dowel, ties

## Resistance design value

$F_{i, R d}=\min \left\{k_{\text {mod }} \cdot F_{i, R, k, \text { timber }} / \gamma_{M, \text { timber }} ; F_{i, R k, \text { stahl }} / \gamma_{M, \text { steel }}\right\}$
with $k_{\text {mod }}$ to EN 1995-1-1 and $\gamma_{M, \text { timber }}=1.3$
For several connectors, 2 characteristic values are given for the steel load-carrying capacity with different partial safety factors gM ,steel.
Both values are to be taken into consideration when determining the design value.
Resistance analysis
$\sum \frac{\mathrm{F}_{\mathrm{i}, \mathrm{Ed}}}{\mathrm{F}_{\mathrm{i}, \mathrm{Rd}}} \leq 1$
Indices
${ }^{\text {a) }}$ Resistance values apply to baseplates 8 mm and 6 mm thick.
${ }^{\text {b) }}$ Resistance values apply to a baseplate 8 mm thick. For a baseplate 6 mm thick, the values marked 1 ) to 6 ) are to be multiplied by the factor from the following table.

| ${ }^{1)}$ | ${ }^{2)}$ | ${ }^{3)}$ | ${ }^{4)}$ | ${ }^{5)}$ | ${ }^{5)}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0,67 | 0,72 | 0,75 | 0,81 | 0,84 | 0,86 |

${ }^{\text {c) }}$ For tensile loading by load $\mathrm{F}_{1, \mathrm{t}}$ dowels are required in addition to the given screws.
${ }^{\text {d) }}$ If screws with threaded length $\ell_{\text {ef }}$ greater than 100 mm are used, the load-carrying capacity $\mathrm{F}_{1, t, \mathrm{R}, \mathrm{k}, \text { timber }}$ can be increased by factor f1,t,timber $=($ lef $/ 100 \mathrm{~mm}) 0.9$.
