

"Innovationen im Holzbau"

GH column base type D extra strong on concrete

Post supports are approved for service classes 1, 2 and 3.

Timber column										
Softwood, C24 or hig	her strengths									
Glulam										
Minimum dimensions min w x min h see structural calculations table										
-										
Timber column fa	steners									
Wood screws	\varnothing 8x70 - ℓ_{ef} \ge 50 mm									
	\emptyset 10x120 - $\ell_{ef} \ge 100 \text{ mm}$									
	\emptyset 10x60, \emptyset 4x60 - $\ell_{ef} \ge 40$ mm									
	\emptyset 12x80 - ℓ_{ef} \ge 60 mm ℓ_{ef} = minimum thread lengths									
	If screws with thread length $\ell_{ m ef}$ greater than 100 mm are used, the resistance can be increased, see structural calculations table, index d)									
Dowel	Ø8 mm, Ø10 mm and Ø12 mm, at least \$235									
1										
In concrete										

The minimum concrete encased depth for concrete encased post supports is 150 mm.

General

The table contains characteristic values of the resistance/load-carrying capacity for determining design values in ultimate limit state.

The resistances/load-carrying capacities apply to the maximum distances given in the structural calculation tables of the load application points from the top of the substrate.

The verification of anchoring of the post support in the subsoil must be provided separately.

In case of horizontal loading of the post support, it is recommended to verify the resistance with the lower value

of the resistances F2/3 and F4/5, if correct layout of the post support in the place of installation is not checked.

Minimum and maximum distances

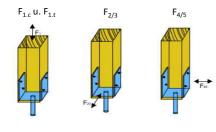

Distance from top of baseplate - top of substrate, see structural calculations table max a

 $e_{2/3}$ - maximum distance between load application - top of substrate in load case $F_{2/3}$

 $e_{4/5}$ - maximum distance between load application - top of substrate in load case $F_{4/5}$

The distances e_{2/3} and e_{4/5} result from the distance max a and the centre of gravity of the load application for the load cases F2/3 and F4/5.

$\Sigma F_{i,Ed}/F_{i,Rd} \le 1$

 $F_{1,c}$ - compressive force (downwards) perpendicular to the baseplate $F_{1,t}$ - tensile force (upwards) perpendicular to the baseplate ${\rm F}_{\rm 2/3}$ - load perpendicular to fasteners in the fin, dowel, ties $\mathsf{F}_{4/5}$ - load parallel to fasteners in the fin, dowel, ties

Resistance design value

 $F_{i,Rd} = min \; \{ \; k_{mod} \cdot F_{i,Rk,timber} \; / \; \gamma_{M,timber} \; ; \; F_{i,Rk,Stahl} \; / \; \gamma_{M,steel} \; \}$

with k_{mod} to EN 1995-1-1 and $\gamma_{\text{M,timber}}$ = 1.3

For several connectors, 2 characteristic values are given for the steel load-carrying capacity with different partial safety factors gM, steel. Both values are to be taken into consideration when determining the design value.

Resistance analysis			
$\sum \frac{F_{i,Ed}}{F_{i,Rd}} \leq 1$			
Indices			

^{a)} Resistance values apply to baseplates 8 mm and 6 mm thick.

^{b)} Resistance values apply to a baseplate 8 mm thick. For a baseplate 6 mm thick, the values marked 1) to 6) are to be multiplied by the factor from the following table.

1)	2)	3)	4)	5)	6)
0,67	0,72	0,75	0,81	0,84	0,86

 $^{\rm c)}$ For tensile loading by load $\rm F_{1,t}$ dowels are required in addition to the given screws.

d) If screws with threaded length ℓ_{ef} greater than 100 mm are used, the load-carrying capacity $F_{1,t,Rk,timber}$ can be increased by factor f1,t,timber = (lef / 100 mm)0.9.
